

# Chemistry marking guide and response

External assessment 2024

## Combination response (110 marks)

### Assessment objectives

This assessment instrument is used to determine student achievement in the following objectives:

1. describe and explain chemical equilibrium systems, oxidation and reduction, properties and structure of organic materials, and chemical synthesis and design
2. apply understanding of chemical equilibrium systems, oxidation and reduction, properties and structure of organic materials, and chemical synthesis and design
3. analyse evidence about chemical equilibrium systems, oxidation and reduction, properties and structure of organic materials, and chemical synthesis and design to identify trends, patterns, relationships, limitations or uncertainty
4. interpret evidence about chemical equilibrium systems, oxidation and reduction, properties and structure of organic materials, and chemical synthesis and design to draw conclusions based on analysis.

**Note:** Objectives 5, 6 and 7 are not assessed in this instrument.

## Purpose

This document consists of a marking guide and a sample response.

The marking guide:

- provides a tool for calibrating external assessment markers to ensure reliability of results
- indicates the correlation, for each question, between mark allocation and qualities at each level of the mark range
- informs schools and students about how marks are matched to qualities in student responses.

The sample response:

- demonstrates the qualities of a high-level response
- has been annotated using the marking guide.

## Mark allocation

Where a response does not meet any of the descriptors for a question or a criterion, a mark of '0' will be recorded.

Where no response to a question has been made, a mark of 'N' will be recorded.

*Allow FT mark/s* — refers to 'follow through', where an error in the prior section of working is used later in the response, a mark (or marks) for the rest of the response can still be awarded so long as it still demonstrates the correct conceptual understanding or skill in the rest of the response.

## Short response: Paper 1

Q	Sample response	The response:
21a)	The reversible arrow indicates that the reaction occurs in both directions (forward and reverse) simultaneously.	<ul style="list-style-type: none"> <li>explains that forward and reverse reactions occur simultaneously [1 mark]</li> </ul>
21b)	$K_c$ is greater than 1, therefore the equilibrium for the reaction lies towards the products.	<ul style="list-style-type: none"> <li>deduces the equilibrium lies towards the products [1 mark]</li> <li>explains that <math>K_c</math> is greater than 1 [1 mark]</li> </ul>
22a)	A condensation reaction occurs when amino acid monomers are joined to form a peptide bond and water is removed.	<ul style="list-style-type: none"> <li>identifies condensation reaction [1 mark]</li> <li>describes that water is removed when the amino acids are joined to form polypeptides [1 mark]</li> </ul>
22b)	A peptide bond is formed.	<ul style="list-style-type: none"> <li>identifies peptide bond [1 mark]</li> </ul>
23a)	KHP is a weak acid. The titration curve contains a buffer region.	<ul style="list-style-type: none"> <li>determines KHP is a weak acid [1 mark]</li> <li>identifies the buffer region [1 mark]</li> </ul>
23b)	KHP does not absorb water from the air; therefore, an accurate concentration can be determined for KHP.	<ul style="list-style-type: none"> <li>explains that [KHP] does not change due to absorption of water from the air [1 mark]</li> </ul>
23c)	$n_{\text{KHP}} = 0.03 \times 0.012 = 0.00036 \text{ mol}$ $n_{\text{KHP}} = n_{\text{NaOH}}$ $[\text{NaOH}] = \frac{0.00036}{0.025} = 0.0144 \text{ mol L}^{-1}$	<ul style="list-style-type: none"> <li>provides suitable substitution [1 mark]</li> <li>calculates [NaOH] [1 mark]</li> </ul>
24	As temperature increases, $pK_w$ decreases ( $K_w$ increases), indicating that equilibrium shifts towards the products. Therefore, the forward reaction is endothermic and increasing the temperature increases $[\text{H}^+]$ and decreases pH.	<ul style="list-style-type: none"> <li>identifies that <math>pK_w</math> decreases as temperature increases [1 mark]</li> <li>determines that the forward reaction is endothermic [1 mark]</li> <li>explains that increasing temperature shifts the equilibrium toward products [1 mark]</li> <li>explains that increasing temperature decreases pH [1 mark]</li> </ul>

Q	Sample response	The response:
25a)	Glucose is an aldose monosaccharide.	<ul style="list-style-type: none"> <li>identifies that glucose is an aldose monosaccharide <b>[1 mark]</b></li> </ul>
25b)	$\alpha$ -glucose has its OH group attached on the opposite side of the carbon ring ( <i>trans</i> ) to the CH <sub>2</sub> OH group, while $\beta$ -glucose has its OH group attached on the same side of the ring ( <i>cis</i> ) as the CH <sub>2</sub> OH group.	<ul style="list-style-type: none"> <li>identifies that <math>\alpha</math>-glucose has its OH group and CH<sub>2</sub>OH group attached to opposite sides of ring (<i>trans</i>) for <b>[1 mark]</b></li> <li>identifies that <math>\beta</math>-glucose has its OH group and CH<sub>2</sub>OH group attached on the same side of the ring (<i>cis</i>) <b>[1 mark]</b></li> </ul>
26a)	I <sup>-</sup> (aq) in KI is the reducing agent because it loses an electron to be oxidised to I <sub>2</sub> (s).	<ul style="list-style-type: none"> <li>identifies that the iodide ion (I<sup>-</sup>) in KI is the reducing agent <b>[1 mark]</b></li> <li>explains I<sup>-</sup> is oxidised by losing an electron <b>[1 mark]</b></li> </ul>
26b)	Reduction half-equation: $2\text{IO}_3^-(\text{aq}) + 12\text{H}^+(\text{aq}) + 10\text{e}^- \rightarrow \text{I}_2(\text{s}) + 6\text{H}_2\text{O}(\text{l})$	<ul style="list-style-type: none"> <li>determines IO<sub>3</sub><sup>-</sup> + H<sup>+</sup> + e<sup>-</sup> are reactants <b>[1 mark]</b></li> <li>determines I<sub>2</sub> + H<sub>2</sub>O are products <b>[1 mark]</b></li> <li>determines the balanced reduction half-equation <b>[1 mark]</b></li> </ul>
27a)	Catalyst concentration (%): 4 Ethanol to seed oil ratio (g/g): 10:1 Temperature (°C): 45	<ul style="list-style-type: none"> <li>identifies optimal reaction conditions are 4% catalyst concentration, 10:1 ethanol to seed oil ratio and 45 °C <b>[1 mark]</b></li> </ul>
27b)	In esterification, free fatty acids (FFAs) react with an alcohol to produce esters and water. In transesterification, esters react with an alcohol to produce fatty acid alkyl esters (FAAEs) (biodiesel) and glycerol. A two-step process maximises the conversion of FFAs to biodiesel (FAAE).	<ul style="list-style-type: none"> <li>explains that esterification converts free fatty acids to esters <b>[1 mark]</b></li> <li>explains that transesterification converts esters to fatty acid alkyl esters <b>[1 mark]</b></li> <li>explains that a two-step process maximises the production of biodiesel <b>[1 mark]</b></li> </ul>

Q	Sample response	The response:
27c)	Increasing the catalyst concentration from 0% to 4% resulted in ~1.8% increase in biodiesel yield from ~91.0% to ~92.8%. Increasing the ethanol–oil ratio from 10:1 g/g to 18:1 g/g resulted in a ~1.9% decrease in biodiesel yield from ~93.2% to ~91.3%. Increasing temperature from 45 °C to 75 °C has minimal effect, decreasing biodiesel yield by ~0.4% from ~92.3% to ~92.0%.	<ul style="list-style-type: none"> <li>determines that increasing catalyst concentration increases biodiesel yield <b>[1 mark]</b></li> <li>determines that increasing ethanol to seed oil ratio decreases biodiesel yield <b>[1 mark]</b></li> <li>determines that increasing temperature results in a slight decrease in biodiesel yield <b>[1 mark]</b></li> <li>identifies data from the graphs to support reasoning <b>[1 mark]</b></li> </ul>
28a)	The isomer is a saturated compound because it contains only single bonds.	<ul style="list-style-type: none"> <li>identifies that the compound is saturated because it contains only single bonds <b>[1 mark]</b></li> </ul>
28b)	Primary haloalkane	<ul style="list-style-type: none"> <li>identifies compound is a primary haloalkane <b>[1 mark]</b></li> </ul>
28c)	$\begin{array}{c} \text{Cl} \\   \\ \text{H}_3\text{C}-\text{C}-\text{CH}_3 \\   \\ \text{CH}_3 \end{array}$ <p>IUPAC name: 2-chloro-2-methylpropane</p>	<ul style="list-style-type: none"> <li>determines structural formula <b>[1 mark]</b></li> <li>determines IUPAC name <b>[1 mark]</b></li> </ul>
29a)	$\begin{array}{c} \text{H} & & \text{H} \\   & & / \\ \text{H}-\text{C} & - & \text{N} \\   & & \backslash \\ \text{H} & & \text{H} \end{array}$	<ul style="list-style-type: none"> <li>describes the structural formula for methylamine <b>[1 mark]</b></li> </ul>
29b)	Added OH <sup>-</sup> would react and accept a proton from CH <sub>3</sub> NH <sub>3</sub> <sup>+</sup> to form water and CH <sub>3</sub> NH <sub>2</sub> (weak base). Thus, equilibrium would shift to the left (reactants) and resist a change in pH.	<ul style="list-style-type: none"> <li>explains CH<sub>3</sub>NH<sub>3</sub><sup>+</sup> reacts with excess OH<sup>-</sup> ions <b>[1 mark]</b></li> <li>explains equilibrium would shift to the left and resist a change in pH <b>[1 mark]</b></li> </ul>

## Paper 2

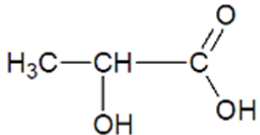

Q	Sample response	The response:
1a)	$[H^+] = 10^{(-pH)}$ $[H^+] = 10^{-2} = 0.01 \text{ mol L}^{-1}$	<ul style="list-style-type: none"> <li>determines <math>[H^+]</math> is <math>0.01 \text{ mol L}^{-1}</math> <b>[1 mark]</b></li> </ul>
1b)	$C_1V_1 = C_2V_2$ Let $C_2 = [H^+]$ $[H^+] = \frac{0.01 \text{ M} \times 30 \text{ mL}}{3000 \text{ mL}} = 0.0001 \text{ mol L}^{-1}$ $pH = -\log_{10}[10^{-4}]$ $pH = 4$	<ul style="list-style-type: none"> <li>determines <math>[H^+]</math> <b>[1 mark]</b></li> <li>calculates pH <b>[1 mark]</b></li> </ul>
2a)	Conjugate base is $In^-$ .	<ul style="list-style-type: none"> <li>identifies conjugate base is <math>In^-</math> <b>[1 mark]</b></li> </ul>
2b)	$K_a = 10^{-pK_a}$ $K_a = 10^{-7.9} = 1.26 \times 10^{-8}$	<ul style="list-style-type: none"> <li>determines <math>K_a</math> is <math>1.26 \times 10^{-8}</math> <b>[1 mark]</b></li> </ul>
2c)	<p>Phenol red changes colour when the concentration of the yellow weak acid form (<math>HIn</math>) equals the concentration of the red conjugate base form (<math>In^-</math>). When <math>[HIn] = [In^-]</math>, the <math>K_a</math> of phenol red equals <math>[H^+]</math> and pH equals the <math>pK_a</math> (7.9).</p> <p>However, the colour change of phenol red occurs over a pH range equal to <math>pK_a \pm 1</math>, because visible colour change can be observed when the <math>[HIn] : [In^-]</math> changes by a ratio of 1:10.</p>	<ul style="list-style-type: none"> <li>identifies that colour change occurs when the <math>[HIn] = [In^-]</math> <b>[1 mark]</b></li> <li>explains that when <math>[HIn] = [In^-]</math>, the <math>K_a</math> of phenol red equals <math>[H^+]</math>, and therefore pH equals the <math>pK_a</math> <b>[1 mark]</b></li> <li>identifies that the pH range of colour change is <math>pK_a \pm 1</math> <b>[1 mark]</b></li> <li>explains that the pH range of colour change occurs either side of <math>pK_a</math> because colour change is detected when the <math>[HIn] : [In^-]</math> changes <b>[1 mark]</b></li> </ul>

Q	Sample response	The response:
3a)	<p>Similarity: both weak acids</p> <p>Difference: ethanoic acid (CH<sub>3</sub>COOH) is weaker than acid I</p> <p>Significance: Ethanoic acid dissociates less to produce a lower [H<sup>+</sup>]</p>	<ul style="list-style-type: none"> <li>identifies that both acids are weak acids <b>[1 mark]</b></li> <li>identifies that ethanoic acid is weaker than acid I <b>[1 mark]</b></li> <li>explains that ethanoic acid dissociates less to produce a lower [H<sup>+</sup>] <b>[1 mark]</b></li> </ul>
3b)	<p>Acid II has a K<sub>a</sub> greater than 1 and is therefore a strong acid, while acid I is a weak acid due to small K<sub>a</sub>. Acid II dissociates to produce more ions in an aqueous solution than acid I. Therefore, acid II has a higher electrical conductivity than acid I.</p>	<ul style="list-style-type: none"> <li>identifies that acid II is stronger than acid I <b>[1 mark]</b></li> <li>explains that acid II dissociates to produce more ions in solution <b>[1 mark]</b></li> <li>determines that the electrical conductivity of acid II will be greater than acid I <b>[1 mark]</b></li> </ul>
3c)	$[\text{H}_3\text{O}^+] = [\text{CH}_3\text{COO}^-] = x$ $[\text{CH}_3\text{COOH}] = \frac{[\text{H}_3\text{O}^+][\text{CH}_3\text{COO}^-]}{K_a}$ $0.2 = \frac{(x)^2}{1.8 \times 10^{-5}}$ $[\text{H}_3\text{O}^+] = 1.9 \times 10^{-3} \text{ M}$ $\text{pH} = -\log_{10}[\text{H}_3\text{O}^+]$ $\text{pH} = 3$	<ul style="list-style-type: none"> <li>identifies <math>[\text{H}_3\text{O}^+] = [\text{CH}_3\text{COO}^-]</math> <b>[1 mark]</b></li> <li>determines <math>[\text{H}_3\text{O}^+]</math> <b>[1 mark]</b></li> <li>calculates pH <b>[1 mark]</b></li> </ul>
4a)	<p>Enzymes convert starch into glucose via hydrolysis that breaks the glycosidic bond.</p>	<ul style="list-style-type: none"> <li>identifies that enzymes break glycosidic bonds in starch to form glucose <b>[1 mark]</b></li> <li>explains that enzymes convert starch to glucose via hydrolysis <b>[1 mark]</b></li> </ul>
